

Python Programming Glossary – 100 Key Terms

1. Algorithm – A step-by-step procedure for solving a problem.
2. Argument – A value passed into a function when it is called.
3. Arithmetic Operator – Symbols like +, -, *, / used for math operations.
4. Assignment Operator – Used to store values, e.g., = or +=.
5. Attribute – A value or method associated with an object.
6. Boolean – A data type with only True or False.
7. Break Statement – Stops a loop immediately.
8. Bytecode – Low-level instructions Python compiles your code into before execution.
9. Callable – Anything that can be called like a function.
10. Class – A blueprint for creating objects.
11. Comment – Notes in code ignored by Python, starting with #.
12. Comparison Operators – Operators like ==, <, >= for comparing values.
13. Compiler – Converts code into another form; Python uses a bytecode compiler internally.
14. Concatenation – Joining strings or sequences together.
15. Conditional Statement – Code that runs only if a condition is true.
16. Constant – A variable meant not to change.
17. Constructor – A method (`__init__`) that initializes new objects.
18. Continue Statement – Skips to the next loop iteration.
19. Data Structure – A way to store and organize data.
20. Data Type – The type of data: int, float, str, list, etc.
21. Debugger – A tool that helps find and fix errors.
22. Dictionary – A key-value data structure.
23. Docstring – A special multi-line string that documents code.
24. Dynamic Typing – Python decides variable types at runtime.
25. Exception – An error detected during execution.
26. Exception Handling – Managing errors using try and except.
27. Expression – Any valid combination producing a result.
28. Float – A number with decimals.
29. For Loop – A loop that iterates over items.
30. Function – Reusable block of code defined with def.
31. Function Call – Using a function by its name with parentheses.
32. Garbage Collection – Automatic memory cleanup.

33. Generator – A function that yields values one at a time.
34. Global Variable – A variable defined outside functions.
35. IDE – Integrated Development Environment.
36. Identifier – Name given to variables, functions, classes.
37. If Statement – A decision-making structure.
38. Immutable Object – Value cannot change (tuple, string).
39. Import Statement – Brings modules into a program.
40. Indentation – Spaces or tabs used to define code blocks.
41. Index – Position in a sequence, starting at 0.
42. Iterable – Object that can return items one at a time.
43. Iterator – Object used to iterate through an iterable.
44. Keyword – Reserved word like for, if, class.
45. Lambda Function – Small anonymous function.
46. Library – Collection of modules.
47. List – Mutable sequence of items.
48. List Comprehension – One-line list creation.
49. Literal – A fixed value like 10 or "hello".
50. Loop – Repeating structure using for or while.
51. Method – A function belonging to an object.
52. Module – A Python file containing code.
53. Mutable Object – An object that can change.
54. Namespace – Container for names (variables, functions).
55. None – Special value meaning "no value."
56. Object – Instance of a class.
57. OOP – Object-oriented programming approach.
58. Operator – Symbol performing an action.
59. Operand – Value acted on by an operator.
60. Package – Directory containing modules.
61. Parameter – Variable in a function definition.
62. Parent Class – A class providing attributes to a child.
63. Pass Statement – Placeholder that does nothing.
64. PEP – Python Enhancement Proposal.
65. pep8 – Python's style guideline.

66. Print Function – Displays output.
67. Property – Attribute with getter/setter behavior.
68. Recursion – Function calling itself.
69. Return Statement – Sends value out of a function.
70. Runtime – When a program is running.
71. Scope – Area where a variable is accessible.
72. Script – A Python file run directly.
73. Set – Unordered collection of unique items.
74. Shell – Interactive environment for Python commands.
75. Single Inheritance – One parent class.
76. Slice – Portion of a sequence.
77. Soft Copy – Reference to the same object.
78. Statement – A complete unit of code.
79. String – Sequence of characters.
80. Syntax – Rules for writing Python code.
81. Syntax Error – Mistake preventing execution.
82. Tuple – Immutable ordered collection.
83. Type Casting – Converting data types.
84. Type Error – Wrong data type used.
85. Variable – Named reference to a value.
86. Virtual Environment – Isolated project environment.
87. While Loop – Loop running while condition is true.
88. Whitespace – Spaces, tabs, newlines.
89. Yield Statement – Produces generator values.
90. ZeroDivisionError – Dividing by zero error.
91. Boolean Expression – Returns True or False.
92. Call Stack – Tracks function calls.
93. Decorator – Modifies function behavior.
94. Duck Typing – Behavior-based type system.
95. EOFError – Unexpected end-of-input error.
96. Keyword Argument – Naming parameters in calls.
97. Local Variable – Exists only in a function.
98. List Method – Built-in list operations.

99. Memory Management – Automatic handling of memory.

100. Wrapper Function – Adds functionality to another function.
